ABSTRACT

This Technical Memorandum identifies biogeographic provinces and bioclimatic regions containing UNESCO biosphere reserves. As an aid to identifying potential biosphere reserves in provinces and regions currently without such representation, the document lists all large (50 km² plus) parks and reserves in each province and region of Australia.

INTRODUCTION

Australia has nominated eleven national and other parks (plus Macquarie Island) for inclusion in the UNESCO international biosphere reserves system (Fig. 1, Table 1).

This Technical Memorandum reports the use of the Australian Resources Information System (ARIS) to check the extent to which these reserves represent Australia's main biogeographical provinces, i.e. to identify biogeographical provinces (a) containing and (b) not containing a biosphere reserve.

There is no universally accepted regionalization of Australia into biogeographic provinces. We have therefore elected to evaluate the range of existing reserves against two candidate biogeographical regionalizations, both of which are sensible and legitimate. Figure 2 shows biosphere reserves overlaid on a map of bioclimatic regions developed by Walker and Gillison (1982). Figure 3 show biosphere reserves overlaid on a map of Udvardy's biogeographical provinces as prepared for UNESCO (Udvardy 1975).

Perusal of Fig. 2 shows that eight of Walker and Gillison's 20 bioclimatic regions do not have a reserve either within or abutting their boundaries:

A1S	Hot, very low seasonal growth index	(WA, NT, Q)
AB2S	Warm, low seasonal growth index	(Q)
AB3S	Warm, medium seasonal growth index	(Q)
AB4	Warm, low growth index	(NSW, Q)
AB5	Warm, low to medium growth index	(NSW, Q)
AB6	Warm, very low to high growth index	(NSW, Q)
AB7	Warm, high growth index	(Q)
B3S	Cool, medium seasonal growth index	(WA)

Similarly Fig. 3 shows that four of Udvardy's 13 biogeographical provinces do not have a reserve either within or abutting their boundaries:

Western mulga	(WA)
Northern grasslands	(WA, NT, Q)

Brigalow (Q)
Queensland coastal (Q)

POSSIBLE NEW BIOSPHERE RESERVES

There are some 350 national parks and reserves in Australia of more than 50 km² (Fig. 4).

Their distribution is such that at least one of these large parks occurs wholly or partly in (a) each Walker and Gillison bioclimatic region and (b) each Udvardy biogeographical province.

Appendices 1 and 2 list all large parks for each bioclimatic region and each biogeographical province. These appendices can be used to identify candidate biosphere reserves in regions currently without biosphere reserve representation. For example, the largest candidate park/reserve in each unrepresented region is as follows:

Province	Park	Area (km ²)
(a) Udvardy provinces		
Western mulga	Rudall River	15 695
Northern grasslands	Biamanga	337
Brigalow	Carnarvon	2 230
Queensland coastal	Lakefield	5 370
(b) Bioclimatic regions		
Hot, very low seasonal growth index (G.I.)	Connell's Lagoon	259
Warm, low seasonal G.I.	Bowling Green Bay	554
Warm, medium seasonal G.I.	Lakefield	5 370
Warm, low G.I.	Carnarvon	2 230
Warm, low-medium G.I.	Great Sandy	524
Warm, very low-high G.I.	Cooloola	394
Warm, high G.I.	Daintree River	565
Cool, medium seasonal G.I.	Shannon	520

DISCUSSION

This document does not purport to directly suggest parks for inclusion in the Australian biosphere reserves scheme. It shows how a computerized geographic information system can be used to rapidly generate options according to various criteria: for example, the above analyses could have been repeated for the environmental regions developed by Laut et al. (1975); alternatively the soil-vegetation combinations in each region could be measured and a search made for a 'representative' park for each region.

Whilst many analytical exercises are possible it has to be remembered that the data used above are 'dominance' coded to half degree grid cells which range between 2230 and 3043 km² in size. A more precise and accurate analysis (say using eighth degree cells) would be enormously expensive in terms of data acquisition costs.
